

Adding a new feature/class to the project

Before creating your new feature branch in IntelliJ (to add a new class, e.g., CsvException), you **should pull the latest changes** from the remote (GitHub) repository first.

That ensures your local ‘main’ branch is up to date in case teammates have made commits since you last worked on it.

Here’s a step-by-step guide when using the IntelliJ IDE

1. Update your local repo first

1. In IntelliJ, open the **Git** tool window. Look for the  button.

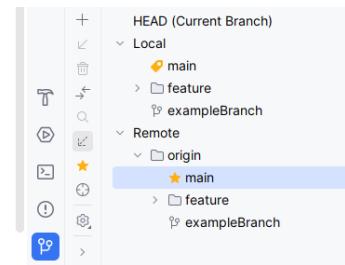

Check the edge toolbar (bottom-right/left)

or

Menu → View → Tool Windows → Git

2. Switch to the **remote** branch you’ll branch **from** (usually main):

- o Right-click the branch name.
- o Select main → **Checkout**.

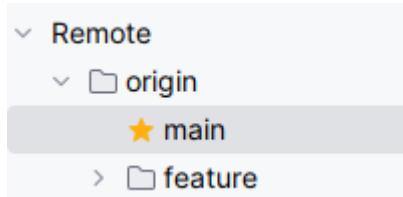

3. Pull the latest commits:

- o Menu: **Git → Pull...**
- o Confirm the remote (usually origin/main).
- o IntelliJ will fetch and merge the newest changes.

 Now your base branch is up to date.

2. Create a new feature branch

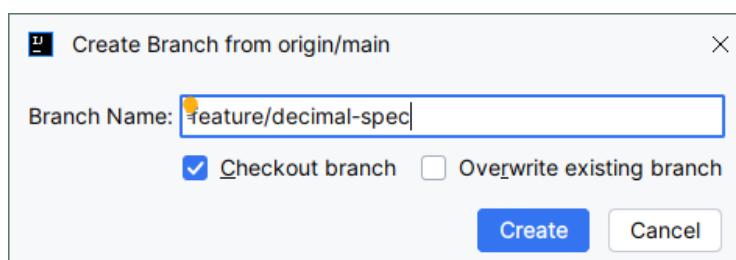

1. Right-click the **main** branch.

2. Choose **New Branch from origin/main...**

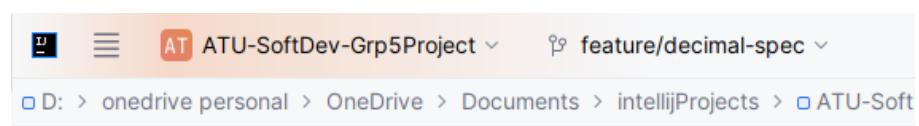

3. Enter a clear name, for example: `feature/decimal-spec`

4. Make sure “Checkout branch” is ticked so you immediately switch to it.

5. Press **Create**.

Now IntelliJ will show you're on that branch.

3. Start working on your feature

- Create the new file: `src/main/java/.../DecimalSpec.java`.
 - Commit regularly with messages like:
 - `feat: add DecimalSpec for BigDecimal scale and rounding rules`
 - When done, push your branch:
`Git → Push...` → confirm origin/feature/decimal-spec.
-

4. Create a Pull Request (PR)

On GitHub (online):

- Open the repository.
 - You'll see a "Compare & pull request" banner for your new branch.
 - Fill in the description and link any related issues.
 - Review the changes in the Files changed tab to confirm everything looks correct.
 - When ready, you can approve and merge the PR yourself, or optionally request a review from another team member before merging..
-
